## Indeks klas

### 2.1 Lista klas

Tutaj znajdują się klasy, struktury, unie i interfejsy wraz z ich krótkimi opisami:

<a href="#">BaseManagerWithConnection</a>	
Base class for managers that require a libvirt connection . . . . .	7
<a href="#">ConnectionInfo</a>	
Structure containing information about a hypervisor connection . . . . .	8
<a href="#">ConnectionManager</a>	
Manages connections to libvirt hypervisors . . . . .	9
<a href="#">ConnectionManagerTests</a>	
. . . . .	11
<a href="#">ExecutionInfo</a>	
Structure containing execution result information . . . . .	11
<a href="#">ExecutionInfoObtainer</a>	
Utility class for executing functions and capturing execution information . . . . .	12
<a href="#">ExecutionInfoObtainerTests</a>	
. . . . .	13
<a href="#">ILibpcapWrapper</a>	
Interface for libpcap wrapper functionality . . . . .	13
<a href="#">ILibvirtWrapper</a>	
Interface for Libvirt wrapper functionality . . . . .	15
<a href="#">LibpcapWrapper</a>	
Concrete implementation of the <a href="#">ILibpcapWrapper</a> interface . . . . .	27
<a href="#">LibvirtWrapper</a>	
Concrete implementation of the <a href="#">ILibvirtWrapper</a> interface . . . . .	30
<a href="#">LibvirtWrapperMock</a>	
. . . . .	42
<a href="#">ListenCallbackArgs</a>	
Structure containing arguments for packet listening callbacks . . . . .	44
<a href="#">NetworkDefinition</a>	
Structure containing network definition in XML format . . . . .	44
<a href="#">Packet</a>	
Structure representing a captured network packet . . . . .	45
<a href="#">PacketSniffer</a>	
Class for capturing network packets . . . . .	45
<a href="#">PacketSnifferException</a>	
Exception class for packet sniffer-related errors . . . . .	48
<a href="#">StreamData</a>	
Structure containing data received from a virtual machine console stream . . . . .	49
<a href="#">StringUtils</a>	
Utility class for string manipulation operations . . . . .	49

<a href="#">StringUtilsTests</a>	50
<a href="#">TestingUtils</a>	50
<a href="#">Version</a>	
Structure representing a semantic version number	50
<a href="#">VersionUtils</a>	
Utility class for version number operations	51
<a href="#">VersionUtilsTests</a>	52
<a href="#">VirtualizationException</a>	
Exception class for virtualization-related errors	52
<a href="#">VirtualizationFacade</a>	
Facade class providing a unified interface for virtualization operations	53
<a href="#">VirtualMachineConsoleManager</a>	
Manages virtual machine console connections	60
<a href="#">VirtualMachineConsoleManagerTests</a>	62
<a href="#">VirtualMachineInfo</a>	
Structure containing basic information about a virtual machine	63
<a href="#">VirtualMachineManager</a>	
Manages virtual machines	63
<a href="#">VirtualMachineManagerMockGetInfoAboutVirtualMachine</a>	66
<a href="#">VirtualMachineManagerTests</a>	68
<a href="#">VirtualNetworkManager</a>	
Manages virtual networks	68

# Dokumentacja klas

### 4.1 Dokumentacja klasy BaseManagerWithConnection

Base class for managers that require a libvirt connection.

```
#include <BaseManagerWithConnection.h>
```

Diagram dziedziczenia dla BaseManagerWithConnection

#### Metody publiczne

- [BaseManagerWithConnection](#) ([ILibvirtWrapper](#) \*libvirt)  
*Constructs a [BaseManagerWithConnection](#) with a specific libvirt wrapper.*
- **BaseManagerWithConnection** ()  
*Constructs a [BaseManagerWithConnection](#) with default libvirt wrapper.*
- void [updateConnection](#) (virConnectPtr conn)  
*Updates the libvirt connection pointer.*

#### Metody chronione

- void **checkIfConnectionIsSet** () const  
*Checks if the connection is set and throws an exception if not.*

#### Atrybuty chronione

- [ILibvirtWrapper](#) \* libvirt
- virConnectPtr conn

### 4.1.1 Opis szczegółowy

Base class for managers that require a libvirt connection.

This abstract class provides common functionality for managers that need access to a libvirt connection and wrapper. It serves as a foundation for specific manager classes like [VirtualMachineManager](#) and [VirtualNetworkManager](#).

### 4.1.2 Dokumentacja konstruktora i destruktora

#### 4.1.2.1 BaseManagerWithConnection()

```
BaseManagerWithConnection::BaseManagerWithConnection (
    ILibvirtWrapper * libvirt) [inline], [explicit]
```

Constructs a [BaseManagerWithConnection](#) with a specific libvirt wrapper.

##### Parametry

<i>libvirt</i>	Pointer to an <a href="#">ILibvirtWrapper</a> implementation.
----------------	---

### 4.1.3 Dokumentacja funkcji składowych

#### 4.1.3.1 updateConnection()

```
void BaseManagerWithConnection::updateConnection (
    virConnectPtr conn)
```

Updates the libvirt connection pointer.

##### Parametry

<i>conn</i>	New connection pointer to use for operations.
-------------	---

Dokumentacja dla tej klasy została wygenerowana z plików:

- src/virt/managers/BaseManagerWithConnection.h
- src/virt/managers/BaseManagerWithConnection.cpp

## 4.2 Dokumentacja struktury ConnectionInfo

Structure containing information about a hypervisor connection.

```
#include <ConnectionInfo.h>
```

### Atrybuty publiczne

- unsigned int **cpuCount**  
*Number of CPUs available on the host.*
- unsigned int **cpuFreq**  
*CPU frequency in MHz.*
- unsigned long **totalMemory**  
*Total memory available on the host in bytes.*
- char **connectionUrl** [256]  
*Connection URL to the hypervisor.*
- char **driverType** [256]  
*Type of the hypervisor driver (e.g., QEMU, KVM).*
- [Version](#) **libVersion**  
*Version of the libvirt library.*
- [Version](#) **driverVersion**  
*Version of the hypervisor driver.*

#### 4.2.1 Opis szczegółowy

Structure containing information about a hypervisor connection.

This structure holds detailed information about the connection to a libvirt hypervisor, including hardware resources and version information.

Dokumentacja dla tej struktury została wygenerowana z pliku:

- src/models/ConnectionInfo.h

## 4.3 Dokumentacja klasy ConnectionManager

Manages connections to libvirt hypervisors.

```
#include <ConnectionManager.h>
```

### Metody publiczne

- [ConnectionManager](#) ([ILibvirtWrapper](#) \*libvirt)  
*Constructs a [ConnectionManager](#) with a specific libvirt wrapper.*
- **ConnectionManager** ()  
*Constructs a [ConnectionManager](#) with default libvirt wrapper.*
- void [initializeConnection](#) (const std::optional< std::string > &customConnectionUrl=std::nullopt)  
*Initializes the connection to the libvirt backend.*
- [ConnectionInfo](#) [getConnectionInfo](#) () const  
*Retrieves detailed information about the current connection.*
- bool [isConnectionAlive](#) () const  
*Checks if the connection is alive and active.*
- virConnectPtr [getConnection](#) () const  
*Gets the raw libvirt connection pointer.*

### 4.3.1 Opis szczegółowy

Manages connections to libvirt hypervisors.

This class handles the lifecycle of connections to libvirt, including initialization, status checking, and retrieving connection information.

### 4.3.2 Dokumentacja konstruktora i destruktor

#### 4.3.2.1 ConnectionManager()

```
ConnectionManager::ConnectionManager (
    ILibvirtWrapper * libvirt) [inline], [explicit]
```

Constructs a [ConnectionManager](#) with a specific libvirt wrapper.

Parametry

<i>libvirt</i>	Pointer to an <a href="#">ILibvirtWrapper</a> implementation.
----------------	---

### 4.3.3 Dokumentacja funkcji składowych

#### 4.3.3.1 getConnection()

```
virConnectPtr ConnectionManager::getConnection () const
```

Gets the raw libvirt connection pointer.

Zwraca

virConnectPtr Pointer to the libvirt connection.

#### 4.3.3.2 getConnectionInfo()

```
ConnectionInfo ConnectionManager::getConnectionInfo () const
```

Retrieves detailed information about the current connection.

Zwraca

[ConnectionInfo](#) Structure containing connection and host information.

#### 4.3.3.3 initializeConnection()

```
void ConnectionManager::initializeConnection (
    const std::optional< std::string > & customConnectionUrl = std::nullopt)
```

Initializes the connection to the libvirt backend.

## Parametry

<i>customConnectionUrl</i>	Optional URL for a custom hypervisor connection. If not provided, default connection is used.
----------------------------	---

## 4.3.3.4 isConnectionAlive()

```
bool ConnectionManager::isConnectionAlive () const
```

Checks if the connection is alive and active.

## Zwraca

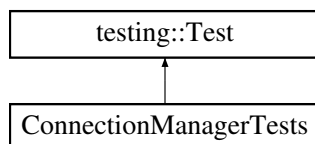

bool True if connection is alive, false otherwise.

Dokumentacja dla tej klasy została wygenerowana z plików:

- src/virt/managers/ConnectionManager.h
- src/virt/managers/ConnectionManager.cpp

## 4.4 Dokumentacja klasy ConnectionManagerTests

Diagram dziedziczenia dla ConnectionManagerTests

## Atrybuty chronione

- [LibvirtWrapperMock](#) **mockLibvirt**
- [ConnectionManager](#) **manager**

Dokumentacja dla tej klasy została wygenerowana z pliku:

- tests/ConnectionManagerTests.cpp

## 4.5 Dokumentacja struktury ExecutionInfo

Structure containing execution result information.

```
#include <ExecutionInfo.h>
```

### Atrybuty publiczne

- bool **errorOccurred**  
*Flag indicating whether an error occurred during execution.*
- char **msg** [128]  
*Error or status message describing the execution result.*

#### 4.5.1 Opis szczegółowy

Structure containing execution result information.

This structure is used to return status and error information from function executions.

Dokumentacja dla tej struktury została wygenerowana z pliku:

- src/models/ExecutionInfo.h

## 4.6 Dokumentacja klasy ExecutionInfoObtainer

Utility class for executing functions and capturing execution information.

```
#include <ExecutionInfoObtainer.h>
```

### Statyczne metody publiczne

- static void [runAndObtainExecutionInfo](#) ([ExecutionInfo](#) \*executionInfo, const std::function< void()> &func)  
*Executes a function and captures execution result information.*

#### 4.6.1 Opis szczegółowy

Utility class for executing functions and capturing execution information.

This class provides a wrapper for running functions while automatically capturing any exceptions and converting them to [ExecutionInfo](#) structures.

#### 4.6.2 Dokumentacja funkcji składowych

##### 4.6.2.1 runAndObtainExecutionInfo()

```
void ExecutionInfoObtainer::runAndObtainExecutionInfo (  
    ExecutionInfo * executionInfo,  
    const std::function< void()> & func) [static]
```

Executes a function and captures execution result information.

This method runs the provided function and populates an [ExecutionInfo](#) structure with the result. If the function throws an exception, the error flag is set and the exception message is captured.

## Parametry

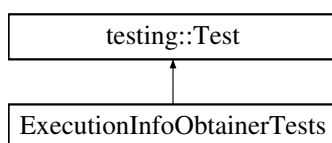

<i>executionInfo</i>	Pointer to <a href="#">ExecutionInfo</a> structure to be filled with results.
<i>func</i>	Function to execute.

Dokumentacja dla tej klasy została wygenerowana z plików:

- src/Utils/ExecutionInfoObtainer.h
- src/Utils/ExecutionInfoObtainer.cpp

## 4.7 Dokumentacja klasy ExecutionInfoObtainerTests

Diagram dziedziczenia dla ExecutionInfoObtainerTests

Dokumentacja dla tej klasy została wygenerowana z pliku:

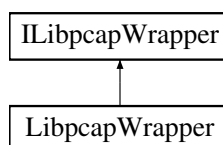

- tests/Utils/ExecutionInfoObtainerTests.cpp

## 4.8 Dokumentacja klasy ILibpcapWrapper

Interface for libpcap wrapper functionality.

```
#include <ILibpcapWrapper.h>
```

Diagram dziedziczenia dla ILibpcapWrapper

### Metody publiczne

- virtual pcap\_t \* [openHandlerLive](#) (const std::string &interfaceName, char \*errBuff)=0  
*Opens a live packet capture handler for a network interface.*
- virtual int [getLinkLayerType](#) (pcap\_t \*handler)=0  
*Gets the link-layer header type for a capture handler.*
- virtual void [closeHandler](#) (pcap\_t \*handler)=0  
*Closes a packet capture handler.*
- virtual int [listenForPackets](#) (pcap\_t \*handler, pcap\_handler callback, u\_char \*args)=0  
*Starts listening for packets on the capture handler.*
- virtual void [close](#) (pcap\_t \*handler)=0  
*Closes the packet capture handler and releases resources.*

### 4.8.1 Opis szczegółowy

Interface for libpcap wrapper functionality.

This abstract class defines an interface for interacting with the libpcap library for packet capture operations.

### 4.8.2 Dokumentacja funkcji składowych

#### 4.8.2.1 close()

```
virtual void ILibpcapWrapper::close (  
    pcap_t * handler) [pure virtual]
```

Closes the packet capture handler and releases resources.

Parametry

<i>handler</i>	<a href="#">Packet</a> capture handler to close.
----------------	--

Implementowany w [LibpcapWrapper](#).

#### 4.8.2.2 closeHandler()

```
virtual void ILibpcapWrapper::closeHandler (  
    pcap_t * handler) [pure virtual]
```

Closes a packet capture handler.

Parametry

<i>handler</i>	<a href="#">Packet</a> capture handler to close.
----------------	--

Implementowany w [LibpcapWrapper](#).

#### 4.8.2.3 getLinkLayerType()

```
virtual int ILibpcapWrapper::getLinkLayerType (  
    pcap_t * handler) [pure virtual]
```

Gets the link-layer header type for a capture handler.

Parametry

<i>handler</i>	Active packet capture handler.
----------------	--------------------------------

Implementowany w [LibpcapWrapper](#).

#### 4.8.2.4 listenForPackets()

```
virtual int ILibpcapWrapper::listenForPackets (  
    pcap_t * handler,  
    pcap_handler callback,  
    u_char * args) [pure virtual]
```

Starts listening for packets on the capture handler.

## Parametry

<i>handler</i>	Active packet capture handler.
<i>callback</i>	Function to call when a packet is captured.
<i>args</i>	User-defined arguments to pass to the callback function.

Implementowany w [LibpcapWrapper](#).

## 4.8.2.5 openHandlerLive()

```
virtual pcap_t * ILibpcapWrapper::openHandlerLive (
    const std::string & interfaceName,
    char * errBuff) [pure virtual]
```

Opens a live packet capture handler for a network interface.

## Parametry

<i>interfaceName</i>	Name of the network interface to capture packets from.
<i>errBuff</i>	Buffer to store error messages.

## Zwraca

pcap\_t\* Pointer to the packet capture handler, or nullptr on failure.

Implementowany w [LibpcapWrapper](#).

Dokumentacja dla tej klasy została wygenerowana z pliku:

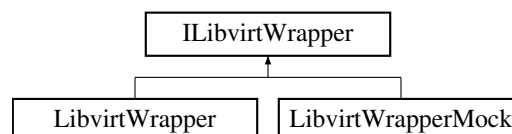

- src/interfaces/ILibpcapWrapper.h

## 4.9 Dokumentacja klasy ILibvirtWrapper

Interface for Libvirt wrapper functionality.

```
#include <ILibvirtWrapper.h>
```

Diagram dziedziczenia dla ILibvirtWrapper

## Metody publiczne

- virtual virNetworkPtr [getNetworkByName](#) (virConnectPtr conn, const std::string &name)=0

*Gets a network by its name.*

- virtual int [destroyNetwork](#) (virNetworkPtr network)=0

*Destroys (stops and removes) a virtual network.*

- virtual std::string [getNetworkDefinition](#) (virNetworkPtr network)=0

*Gets the XML definition of a network.*

### 4.9.1 Opis szczegółowy

Interface for Libvirt wrapper functionality.

This abstract class defines an interface for interacting with the libvirt API.

### 4.9.2 Dokumentacja funkcji składowych

#### 4.9.2.1 attachDeviceToVm()

```
virtual int ILibvirtWrapper::attachDeviceToVm (
    virDomainPtr domain,
    const std::string & deviceDefinition) [pure virtual]
```

Attaches a device to a virtual machine.

**Parametry**

<i>domain</i>	Domain to attach device to.
<i>deviceDefinition</i>	XML string defining the device.

**Zwraca**

int 0 on success, -1 on failure.

Implementowany w [LibvirtWrapper](#).

#### 4.9.2.2 connectionIsAlive()

```
virtual int ILibvirtWrapper::connectionIsAlive (
    virConnectPtr conn) [pure virtual]
```

Checks if a connection is alive.

**Parametry**

<i>conn</i>	Connection to check.
-------------	----------------------

**Zwraca**

int 1 if alive, 0 if not, -1 on error.

Implementowany w [LibvirtWrapper](#).

#### 4.9.2.3 connectOpen()

```
virtual virConnectPtr ILibvirtWrapper::connectOpen (
    const char * name) [pure virtual]
```

Opens a connection to a hypervisor.

##### Parametry

<i>name</i>	URI or name of the hypervisor connection.
-------------	---

##### Zwraca

virConnectPtr Connection handle, or nullptr on failure.

Implementowany w [LibvirtWrapper](#).

#### 4.9.2.4 createNetworkFromXml()

```
virtual virNetworkPtr ILibvirtWrapper::createNetworkFromXml (
    virConnectPtr conn,
    const std::string & networkDefinition) [pure virtual]
```

Creates a virtual network from XML definition.

##### Parametry

<i>conn</i>	Active connection to the hypervisor.
<i>networkDefinition</i>	XML string defining the network.

##### Zwraca

virNetworkPtr Network handle, or nullptr on failure.

Implementowany w [LibvirtWrapper](#).

#### 4.9.2.5 createNewStream()

```
virtual virStreamPtr ILibvirtWrapper::createNewStream (
    virConnectPtr conn) [pure virtual]
```

Creates a new stream object.

##### Parametry

<i>conn</i>	Active connection to the hypervisor.
-------------	--------------------------------------

##### Zwraca

virStreamPtr Stream handle, or nullptr on failure.

Implementowany w [LibvirtWrapper](#).

#### 4.9.2.6 createVirtualMachineFromXml()

```
virtual virDomainPtr ILibvirtWrapper::createVirtualMachineFromXml (
    virConnectPtr conn,
    const char * xmlConfig) [pure virtual]
```

Creates a virtual machine from XML configuration.

**Parametry**

<i>conn</i>	Active connection to the hypervisor.
<i>xmlConfig</i>	XML string describing the VM configuration.

**Zwraca**

virDomainPtr Domain handle for the created VM.

Implementowany w [LibvirtWrapper](#).

**4.9.2.7 destroyNetwork()**

```
virtual int ILibvirtWrapper::destroyNetwork (  
    virNetworkPtr network) [pure virtual]
```

Destroys (stops and removes) a virtual network.

**Parametry**

<i>network</i>	Network to destroy.
----------------	---------------------

**Zwraca**

int 0 on success, -1 on failure.

Implementowany w [LibvirtWrapper](#).

**4.9.2.8 detachDeviceFromVm()**

```
virtual int ILibvirtWrapper::detachDeviceFromVm (  
    virDomainPtr domain,  
    const std::string & deviceDefinition) [pure virtual]
```

Detaches a device from a virtual machine.

**Parametry**

<i>domain</i>	Domain to detach device from.
<i>deviceDefinition</i>	XML string defining the device.

**Zwraca**

int 0 on success, -1 on failure.

Implementowany w [LibvirtWrapper](#).

**4.9.2.9 domainGetInfo()**

```
virtual int ILibvirtWrapper::domainGetInfo (  
    virDomainPtr domain,  
    virDomainInfo & domainInfo) [pure virtual]
```

Gets information about a domain.

**Parametry**

<i>domain</i>	Domain to get information from.
<i>domainInfo</i>	Reference to structure to be filled with domain information.

**Zwraca**

int 0 on success, -1 on failure.

Implementowany w [LibvirtWrapper](#).

**4.9.2.10 domainLookupByName()**

```
virtual virDomainPtr ILibvirtWrapper::domainLookupByName (
    virConnectPtr conn,
    std::string name) [pure virtual]
```

Looks up a domain by its name.

**Parametry**

<i>conn</i>	Active connection to the hypervisor.
<i>name</i>	Name of the domain to look up.

**Zwraca**

virDomainPtr Domain handle, or nullptr if not found.

Implementowany w [LibvirtWrapper](#).

**4.9.2.11 domainLookupByUuid()**

```
virtual virDomainPtr ILibvirtWrapper::domainLookupByUuid (
    virConnectPtr conn,
    const std::string & uuid) [pure virtual]
```

Looks up a domain by its UUID.

**Parametry**

<i>conn</i>	Active connection to the hypervisor.
<i>uuid</i>	UUID string of the domain to find.

**Zwraca**

virDomainPtr Domain handle, or nullptr if not found.

Implementowany w [LibvirtWrapper](#).

**4.9.2.12 finishAndFreeStream()**

```
virtual void ILibvirtWrapper::finishAndFreeStream (
    virStreamPtr stream) [pure virtual]
```

Finishes and frees a stream.

**Parametry**

<i>stream</i>	Stream to finish and free.
---------------	----------------------------

Implementowany w [LibvirtWrapper](#).

**4.9.2.13 freeDomain()**

```
virtual void ILibvirtWrapper::freeDomain (
    virDomainPtr domain) [pure virtual]
```

Frees a domain handle.

**Parametry**

<i>domain</i>	Domain handle to free.
---------------	------------------------

Implementowany w [LibvirtWrapper](#).

**4.9.2.14 getConnectUrl()**

```
virtual std::string ILibvirtWrapper::getConnectUrl (
    virConnectPtr conn) [pure virtual]
```

Gets the connection URI.

**Parametry**

<i>conn</i>	Active connection to the hypervisor.
-------------	--------------------------------------

**Zwraca**

std::string Connection URI string.

Implementowany w [LibvirtWrapper](#).

**4.9.2.15 getDomainName()**

```
virtual std::string ILibvirtWrapper::getDomainName (
    virDomainPtr domain) [pure virtual]
```

Gets the name of a domain.

**Parametry**

<i>domain</i>	Domain to get name from.
---------------	--------------------------

**Zwraca**

std::string Domain name.

Implementowany w [LibvirtWrapper](#).

#### 4.9.2.16 getDomainUUID()

```
virtual int ILibvirtWrapper::getDomainUUID (  
    virDomainPtr domain,  
    std::string & uuid) [pure virtual]
```

Gets the UUID of a domain.

## Parametry

<i>domain</i>	Domain to get UUID from.
<i>uuid</i>	Reference to string to store the UUID.

## Zwraca

int 0 on success, -1 on failure.

Implementowany w [LibvirtWrapper](#).

**4.9.2.17 getDriverType()**

```
virtual std::string ILibvirtWrapper::getDriverType (
    virConnectPtr conn) [pure virtual]
```

Gets the type of hypervisor driver.

## Parametry

<i>conn</i>	Active connection to the hypervisor.
-------------	--------------------------------------

## Zwraca

std::string Driver type (e.g., "QEMU", "KVM").

Implementowany w [LibvirtWrapper](#).

**4.9.2.18 getDriverVersion()**

```
virtual int ILibvirtWrapper::getDriverVersion (
    virConnectPtr conn,
    unsigned long * version) [pure virtual]
```

Gets the version of the hypervisor driver.

## Parametry

<i>conn</i>	Active connection to the hypervisor.
<i>version</i>	Pointer to store the driver version number.

## Zwraca

int 0 on success, -1 on failure.

Implementowany w [LibvirtWrapper](#).

#### 4.9.2.19 getLastError()

```
virtual std::string ILibvirtWrapper::getLastError () [pure virtual]
```

Gets the last error message from libvirt.

##### Zwraca

std::string Last error message.

Implementowany w [LibvirtWrapper](#).

#### 4.9.2.20 getLibVersion()

```
virtual int ILibvirtWrapper::getLibVersion (
    virConnectPtr conn,
    unsigned long * version) [pure virtual]
```

Gets the version of the libvirt library.

##### Parametry

<i>conn</i>	Active connection to the hypervisor.
<i>version</i>	Pointer to store the version number.

##### Zwraca

int 0 on success, -1 on failure.

Implementowany w [LibvirtWrapper](#).

#### 4.9.2.21 getListOfAllDomains()

```
virtual int ILibvirtWrapper::getListOfAllDomains (
    virConnectPtr conn,
    virDomainPtr ** domains) [pure virtual]
```

Gets a list of all domains on the connection.

##### Parametry

<i>conn</i>	Active connection to the hypervisor.
<i>domains</i>	Pointer to array that will be allocated and filled with domain handles.

##### Zwraca

int Number of domains found, or -1 on failure.

Implementowany w [LibvirtWrapper](#).

#### 4.9.2.22 getNetworkByName()

```
virtual virNetworkPtr ILibvirtWrapper::getNetworkByName (
    virConnectPtr conn,
    const std::string & name) [pure virtual]
```

Gets a network by its name.

## Parametry

<i>conn</i>	Active connection to the hypervisor.
<i>name</i>	Name of the network to find.

## Zwraca

virNetworkPtr Network handle, or nullptr if not found.

Implementowany w [LibvirtWrapper](#).

**4.9.2.23 getNetworkDefinition()**

```
virtual std::string ILibvirtWrapper::getNetworkDefinition (  
    virNetworkPtr network) [pure virtual]
```

Gets the XML definition of a network.

## Parametry

<i>network</i>	Network to get definition from.
----------------	---------------------------------

## Zwraca

std::string XML definition of the network.

Implementowany w [LibvirtWrapper](#).

**4.9.2.24 getNodeInfo()**

```
virtual int ILibvirtWrapper::getNodeInfo (  
    virConnectPtr conn,  
    virNodeInfoPtr info) [pure virtual]
```

Gets information about the physical host node.

## Parametry

<i>conn</i>	Active connection to the hypervisor.
<i>info</i>	Pointer to structure to be filled with node information.

## Zwraca

int 0 on success, -1 on failure.

Implementowany w [LibvirtWrapper](#).

**4.9.2.25 getUuidFromDomain()**

```
virtual void ILibvirtWrapper::getUuidFromDomain (  
    virDomainPtr domain,  
    char * uuid) [pure virtual]
```

Retrieves the UUID of a domain.

## Parametry

<i>domain</i>	Domain to get UUID from.
<i>uuid</i>	Buffer to store the UUID string (must be at least VIR_UUID_STRING_BUFLen bytes).

Implementowany w [LibvirtWrapper](#).

**4.9.2.26 openDomainConsole()**

```
virtual int ILibvirtWrapper::openDomainConsole (  
    virDomainPtr domain,  
    virStreamPtr stream) [pure virtual]
```

Opens a console connection to a domain.

## Parametry

<i>domain</i>	Domain to open console for.
<i>stream</i>	Stream to use for console I/O.

## Zwraca

int 0 on success, -1 on failure.

Implementowany w [LibvirtWrapper](#).

**4.9.2.27 receiveDataFromStream()**

```
virtual int ILibvirtWrapper::receiveDataFromStream (  
    virStreamPtr stream,  
    char * buffer,  
    int bufferSize) [pure virtual]
```

Receives data from a stream.

## Parametry

<i>stream</i>	Active stream to read from.
<i>buffer</i>	Buffer to store received data.
<i>bufferSize</i>	Size of the buffer.

## Zwraca

int Number of bytes read, 0 on EOF, -1 on error.

Implementowany w [LibvirtWrapper](#).

**4.9.2.28 sendDataToStream()**

```
virtual void ILibvirtWrapper::sendDataToStream (  
    virStreamPtr stream,  
    const char * buffer,  
    int bufferSize) [pure virtual]
```

Sends data to a stream.

## Parametry

<i>stream</i>	Active stream to write to.
<i>buffer</i>	Data to send.
<i>bufferSize</i>	Size of data to send.

Implementowany w [LibvirtWrapper](#).

## 4.9.2.29 updateVmDevice()

```
virtual int ILibvirtWrapper::updateVmDevice (
    virDomainPtr domain,
    const std::string & deviceDefinition) [pure virtual]
```

Updates a device configuration in a virtual machine.

## Parametry

<i>domain</i>	Domain to update device in.
<i>deviceDefinition</i>	XML string defining the new device configuration.

## Zwraca

int 0 on success, -1 on failure.

Implementowany w [LibvirtWrapper](#).

*Closes the packet capture handler and releases resources.*

### 4.10.1 Opis szczegółowy

Concrete implementation of the [ILibpcapWrapper](#) interface.

This class provides actual implementations for packet capture operations using the libpcap library.

### 4.10.2 Dokumentacja funkcji składowych

#### 4.10.2.1 close()

```
void LibpcapWrapper::close (
    pcap_t * handler) [override], [virtual]
```

Closes the packet capture handler and releases resources.

##### Parametry

<i>handler</i>	<a href="#">Packet</a> capture handler to close.
----------------	--

Implementuje [ILibpcapWrapper](#).

#### 4.10.2.2 closeHandler()

```
void LibpcapWrapper::closeHandler (
    pcap_t * handler) [override], [virtual]
```

Closes a packet capture handler.

##### Parametry

<i>handler</i>	<a href="#">Packet</a> capture handler to close.
----------------	--

Implementuje [ILibpcapWrapper](#).

#### 4.10.2.3 getLinkLayerType()

```
int LibpcapWrapper::getLinkLayerType (
    pcap_t * handler) [override], [virtual]
```

Gets the link-layer header type for a capture handler.

## Parametry

<i>handler</i>	Active packet capture handler.
----------------	--------------------------------

## Zwraca

int Link-layer header type identifier.

Implementuje [ILibpcapWrapper](#).

## 4.10.2.4 listenForPackets()

```
int LibpcapWrapper::listenForPackets (  
    pcap_t * handler,  
    pcap_handler callback,  
    u_char * args) [override], [virtual]
```

Starts listening for packets on the capture handler.

## Parametry

<i>handler</i>	Active packet capture handler.
<i>callback</i>	Function to call when a packet is captured.
<i>args</i>	User-defined arguments to pass to the callback function.

## Zwraca

int Number of packets processed, or error code.

Implementuje [ILibpcapWrapper](#).

## 4.10.2.5 openHandlerLive()

```
pcap_t * LibpcapWrapper::openHandlerLive (  
    const std::string & interfaceName,  
    char * errBuff) [override], [virtual]
```

Opens a live packet capture handler for a network interface.

## Parametry

<i>interfaceName</i>	Name of the network interface to capture packets from.
<i>errBuff</i>	Buffer to store error messages if opening fails.

## Zwraca

pcap\_t\* Pointer to the packet capture handler, or nullptr on failure.

Implementuje [ILibpcapWrapper](#).

- void [finishAndFreeStream](#) (virStreamPtr stream) override  
*Finishes and frees a stream.*
- virNetworkPtr [createNetworkFromXml](#) (virConnectPtr conn, const std::string &networkDefinition) override  
*Creates a virtual network from XML definition.*
- int [attachDeviceToVm](#) (virDomainPtr domain, const std::string &deviceDefinition) override  
*Attaches a device to a virtual machine.*
- int [detachDeviceFromVm](#) (virDomainPtr domain, const std::string &deviceDefinition) override  
*Detaches a device from a virtual machine.*
- int [updateVmDevice](#) (virDomainPtr domain, const std::string &deviceDefinition) override  
*Updates a device configuration in a virtual machine.*
- virNetworkPtr [getNetworkByName](#) (virConnectPtr conn, const std::string &name) override  
*Gets a network by its name.*
- int [destroyNetwork](#) (virNetworkPtr network) override  
*Destroys (stops and removes) a virtual network.*
- std::string [getNetworkDefinition](#) (virNetworkPtr network) override  
*Gets the XML definition of a network.*

### 4.11.1 Opis szczegółowy

Concrete implementation of the [ILibvirtWrapper](#) interface.

This class provides actual implementations for connecting to the libvirt C API.

### 4.11.2 Dokumentacja funkcji składowych

#### 4.11.2.1 attachDeviceToVm()

```
int LibvirtWrapper::attachDeviceToVm (
    virDomainPtr domain,
    const std::string & deviceDefinition) [override], [virtual]
```

Attaches a device to a virtual machine.

#### Parametry

<i>domain</i>	Domain to attach device to.
<i>deviceDefinition</i>	XML string defining the device.

#### Zwraca

int 0 on success, -1 on failure.

Implementuje [ILibvirtWrapper](#).

#### 4.11.2.2 connectionIsAlive()

```
int LibvirtWrapper::connectionIsAlive (
    virConnectPtr conn) [override], [virtual]
```

Checks if a connection is alive.

##### Parametry

<i>conn</i>	Connection to check.
-------------	----------------------

##### Zwraca

int 1 if alive, 0 if not, -1 on error.

Implementuje [ILibvirtWrapper](#).

#### 4.11.2.3 connectOpen()

```
virConnectPtr LibvirtWrapper::connectOpen (
    const char * connectionUri) [override], [virtual]
```

Opens a connection to the hypervisor.

##### Parametry

<i>connectionUri</i>	The name or URI of the hypervisor to connect to.
----------------------	--

##### Zwraca

virConnectPtr A pointer to the connection object on success.

Implementuje [ILibvirtWrapper](#).

#### 4.11.2.4 createNetworkFromXml()

```
virNetworkPtr LibvirtWrapper::createNetworkFromXml (
    virConnectPtr conn,
    const std::string & networkDefinition) [override], [virtual]
```

Creates a virtual network from XML definition.

##### Parametry

<i>conn</i>	Active connection to the hypervisor.
<i>networkDefinition</i>	XML string defining the network.

##### Zwraca

virNetworkPtr Network handle, or nullptr on failure.

Implementuje [ILibvirtWrapper](#).

#### 4.11.2.5 createNewStream()

```
virStreamPtr LibvirtWrapper::createNewStream (
    virConnectPtr conn) [override], [virtual]
```

Creates a new stream object.

## Parametry

<i>conn</i>	Active connection to the hypervisor.
-------------	--------------------------------------

## Zwraca

virStreamPtr Stream handle, or nullptr on failure.

Implementuje [ILibvirtWrapper](#).

**4.11.2.6 createVirtualMachineFromXml()**

```
virDomainPtr LibvirtWrapper::createVirtualMachineFromXml (  
    virConnectPtr conn,  
    const char * xmlConfig) [override], [virtual]
```

Creates a virtual machine from an XML configuration.

## Parametry

<i>conn</i>	The active connection to the hypervisor.
<i>xmlConfig</i>	The XML string describing the VM configuration.

## Zwraca

virDomainPtr A pointer to the newly created virtual machine domain.

Implementuje [ILibvirtWrapper](#).

**4.11.2.7 destroyNetwork()**

```
int LibvirtWrapper::destroyNetwork (  
    virNetworkPtr network) [override], [virtual]
```

Destroys (stops and removes) a virtual network.

## Parametry

<i>network</i>	Network to destroy.
----------------	---------------------

## Zwraca

int 0 on success, -1 on failure.

Implementuje [ILibvirtWrapper](#).

**4.11.2.8 detachDeviceFromVm()**

```
int LibvirtWrapper::detachDeviceFromVm (  
    virDomainPtr domain,  
    const std::string & deviceDefinition) [override], [virtual]
```

Detaches a device from a virtual machine.

**Parametry**

<i>domain</i>	Domain to detach device from.
<i>deviceDefinition</i>	XML string defining the device.

**Zwraca**

int 0 on success, -1 on failure.

Implementuje [ILibvirtWrapper](#).

**4.11.2.9 domainGetInfo()**

```
int LibvirtWrapper::domainGetInfo (
    virDomainPtr domain,
    virDomainInfo & domainInfo) [override], [virtual]
```

Gets information about a domain.

**Parametry**

<i>domain</i>	Domain to get information from.
<i>domainInfo</i>	Reference to structure to be filled with domain information.

**Zwraca**

int 0 on success, -1 on failure.

Implementuje [ILibvirtWrapper](#).

**4.11.2.10 domainLookupByName()**

```
virDomainPtr LibvirtWrapper::domainLookupByName (
    virConnectPtr conn,
    std::string name) [override], [virtual]
```

Looks up a domain by its name.

**Parametry**

<i>conn</i>	Active connection to the hypervisor.
<i>name</i>	Name of the domain to look up.

**Zwraca**

virDomainPtr Domain handle, or nullptr if not found.

Implementuje [ILibvirtWrapper](#).

**4.11.2.11 domainLookupByUuid()**

```
virDomainPtr LibvirtWrapper::domainLookupByUuid (
    virConnectPtr conn,
    const std::string & uuid) [override], [virtual]
```

Looks up a domain by its UUID.

**Parametry**

<i>conn</i>	Active connection to the hypervisor.
<i>uuid</i>	UUID string of the domain to find.

**Zwraca**

virDomainPtr Domain handle, or nullptr if not found.

Implementuje [ILibvirtWrapper](#).

**4.11.2.12 finishAndFreeStream()**

```
void LibvirtWrapper::finishAndFreeStream (  
    virStreamPtr stream) [override], [virtual]
```

Finishes and frees a stream.

**Parametry**

<i>stream</i>	Stream to finish and free.
---------------	----------------------------

Implementuje [ILibvirtWrapper](#).

**4.11.2.13 freeDomain()**

```
void LibvirtWrapper::freeDomain (  
    virDomainPtr domain) [override], [virtual]
```

Frees a domain handle.

**Parametry**

<i>domain</i>	Domain handle to free.
---------------	------------------------

Implementuje [ILibvirtWrapper](#).

**4.11.2.14 getConnectUrl()**

```
std::string LibvirtWrapper::getConnectUrl (  
    virConnectPtr conn) [override], [virtual]
```

Gets the connection URI.

**Parametry**

<i>conn</i>	Active connection to the hypervisor.
-------------	--------------------------------------

**Zwraca**

std::string Connection URI string.

Implementuje [ILibvirtWrapper](#).

#### 4.11.2.15 `getDomainName()`

```
std::string LibvirtWrapper::getDomainName (  
    virDomainPtr domain)    [override], [virtual]
```

Gets the name of a domain.

## Parametry

<i>domain</i>	Domain to get name from.
---------------	--------------------------

## Zwraca

std::string Domain name.

Implementuje [ILibvirtWrapper](#).

**4.11.2.16 getDomainUUID()**

```
int LibvirtWrapper::getDomainUUID (
    virDomainPtr domain,
    std::string & uuid) [override], [virtual]
```

Gets the UUID of a domain.

## Parametry

<i>domain</i>	Domain to get UUID from.
<i>uuid</i>	Reference to string to store the UUID.

## Zwraca

int 0 on success, -1 on failure.

Implementuje [ILibvirtWrapper](#).

**4.11.2.17 getDriverType()**

```
std::string LibvirtWrapper::getDriverType (
    virConnectPtr conn) [override], [virtual]
```

Gets the type of hypervisor driver.

## Parametry

<i>conn</i>	Active connection to the hypervisor.
-------------	--------------------------------------

## Zwraca

std::string Driver type (e.g., "QEMU", "KVM").

Implementuje [ILibvirtWrapper](#).

**4.11.2.18 getDriverVersion()**

```
int LibvirtWrapper::getDriverVersion (
    virConnectPtr conn,
    unsigned long * version) [override], [virtual]
```

Gets the version of the hypervisor driver.

**Parametry**

<i>conn</i>	Active connection to the hypervisor.
<i>version</i>	Pointer to store the driver version number.

**Zwraca**

int 0 on success, -1 on failure.

Implementuje [ILibvirtWrapper](#).

**4.11.2.19 getLastError()**

```
std::string LibvirtWrapper::getLastError () [override], [virtual]
```

Gets the last error message from libvirt.

**Zwraca**

std::string Last error message.

Implementuje [ILibvirtWrapper](#).

**4.11.2.20 getLibVersion()**

```
int LibvirtWrapper::getLibVersion (  
    virConnectPtr conn,  
    unsigned long * libVersion) [override], [virtual]
```

Gets the version of the libvirt library.

**Parametry**

<i>conn</i>	Active connection to the hypervisor.
<i>libVersion</i>	Pointer to store the version number.

**Zwraca**

int 0 on success, -1 on failure.

Implementuje [ILibvirtWrapper](#).

**4.11.2.21 getListOfAllDomains()**

```
int LibvirtWrapper::getListOfAllDomains (  
    virConnectPtr conn,  
    virDomainPtr ** domains) [override], [virtual]
```

Gets a list of all domains on the connection.

## Parametry

<i>conn</i>	Active connection to the hypervisor.
<i>domains</i>	Pointer to array that will be allocated and filled with domain handles.

## Zwraca

int Number of domains found, or -1 on failure.

Implementuje [ILibvirtWrapper](#).

**4.11.2.22 getNetworkByName()**

```
virNetworkPtr LibvirtWrapper::getNetworkByName (  
    virConnectPtr conn,  
    const std::string & name) [override], [virtual]
```

Gets a network by its name.

## Parametry

<i>conn</i>	Active connection to the hypervisor.
<i>name</i>	Name of the network to find.

## Zwraca

virNetworkPtr Network handle, or nullptr if not found.

Implementuje [ILibvirtWrapper](#).

**4.11.2.23 getNetworkDefinition()**

```
std::string LibvirtWrapper::getNetworkDefinition (  
    virNetworkPtr network) [override], [virtual]
```

Gets the XML definition of a network.

## Parametry

<i>network</i>	Network to get definition from.
----------------	---------------------------------

## Zwraca

std::string XML definition of the network.

Implementuje [ILibvirtWrapper](#).

**4.11.2.24 getNodeInfo()**

```
int LibvirtWrapper::getNodeInfo (  
    virConnectPtr conn,  
    virNodeInfoPtr info) [override], [virtual]
```

Gets information about the physical host node.

**Parametry**

<i>conn</i>	Active connection to the hypervisor.
<i>info</i>	Pointer to structure to be filled with node information.

**Zwraca**

int 0 on success, -1 on failure.

Implementuje [ILibvirtWrapper](#).

**4.11.2.25 getUuidFromDomain()**

```
void LibvirtWrapper::getUuidFromDomain (  
    virDomainPtr domain,  
    char * uuid) [override], [virtual]
```

Retrieves the UUID of the given domain.

**Parametry**

<i>domain</i>	The domain to get the UUID from.
<i>uuid</i>	A buffer to store the resulting UUID string.

Implementuje [ILibvirtWrapper](#).

**4.11.2.26 openDomainConsole()**

```
int LibvirtWrapper::openDomainConsole (  
    virDomainPtr domain,  
    virStreamPtr stream) [override], [virtual]
```

Opens a console connection to a domain.

**Parametry**

<i>domain</i>	Domain to open console for.
<i>stream</i>	Stream to use for console I/O.

**Zwraca**

int 0 on success, -1 on failure.

Implementuje [ILibvirtWrapper](#).

**4.11.2.27 receiveDataFromStream()**

```
int LibvirtWrapper::receiveDataFromStream (  
    virStreamPtr stream,  
    char * buffer,  
    int bufferSize) [override], [virtual]
```

Receives data from a stream.

## Parametry

<i>stream</i>	Active stream to read from.
<i>buffer</i>	Buffer to store received data.
<i>bufferSize</i>	Size of the buffer.

## Zwraca

int Number of bytes read, 0 on EOF, -1 on error.

Implementuje [ILibvirtWrapper](#).

**4.11.2.28 sendDataToStream()**

```
void LibvirtWrapper::sendDataToStream (  
    virStreamPtr stream,  
    const char * buffer,  
    int bufferSize) [override], [virtual]
```

Sends data to a stream.

## Parametry

<i>stream</i>	Active stream to write to.
<i>buffer</i>	Data to send.
<i>bufferSize</i>	Size of data to send.

Implementuje [ILibvirtWrapper](#).

**4.11.2.29 updateVmDevice()**

```
int LibvirtWrapper::updateVmDevice (  
    virDomainPtr domain,  
    const std::string & deviceDefinition) [override], [virtual]
```

Updates a device configuration in a virtual machine.

## Parametry

<i>domain</i>	Domain to update device in.
<i>deviceDefinition</i>	XML string defining the new device configuration.

## Zwraca

int 0 on success, -1 on failure.

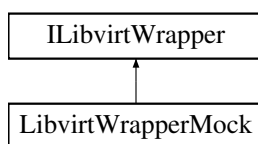

Implementuje [ILibvirtWrapper](#).

## 4.13 Dokumentacja struktury ListenCallbackArgs

Structure containing arguments for packet listening callbacks.

```
#include <ListenCallbackArgs.h>
```

### Atrybuty publiczne

- [PacketSniffer](#) \* **sniffer**  
*Pointer to the [PacketSniffer](#) instance handling the capture.*
- std::string **interfaceName**  
*Name of the network interface being monitored.*

### 4.13.1 Opis szczegółowy

Structure containing arguments for packet listening callbacks.

This structure is passed to packet capture callback functions to provide context about the packet sniffer and interface being monitored.

Dokumentacja dla tej struktury została wygenerowana z pliku:

- src/models/ListenCallbackArgs.h

## 4.14 Dokumentacja struktury NetworkDefinition

Structure containing network definition in XML format.

```
#include <NetworkDefinition.h>
```

### Atrybuty publiczne

- char **content** [4096]  
*XML content defining the network configuration.*

#### 4.14.1 Opis szczegółowy

Structure containing network definition in XML format.

This structure holds the XML configuration for defining virtual networks.

Dokumentacja dla tej struktury została wygenerowana z pliku:

- src/models/NetworkDefinition.h

## 4.15 Dokumentacja struktury Packet

Structure representing a captured network packet.

```
#include <Packet.h>
```

### Atrybuty publiczne

- char **interfaceName** [64]  
*Name of the network interface where the packet was captured.*
- unsigned char \* **content**  
*Pointer to the raw packet data.*
- int **contentLength**  
*Length of the packet content in bytes.*
- unsigned int **timestampMicroseconds**  
*Timestamp of packet capture in microseconds.*

#### 4.15.1 Opis szczegółowy

Structure representing a captured network packet.

This structure holds all the information about a single captured packet, including its content, length, timestamp, and the interface it was captured on.

Dokumentacja dla tej struktury została wygenerowana z pliku:

- src/models/Packet.h

## 4.16 Dokumentacja klasy PacketSniffer

Class for capturing network packets.

```
#include <PacketSniffer.h>
```

## Metody publiczne

- **PacketSniffer ()**  
*Constructs a [PacketSniffer](#) with default libpcap wrapper.*
- pcap\_t \* **openSnifferHandler** (const std::string &interfaceName)  
*Opens a packet capture handler for the specified network interface.*
- bool **listenForPacket** (pcap\_t \*snifferHandler, const std::string &interfaceName)  
*Listens for a single packet on the specified interface.*
- void **closeAndStopListening** (pcap\_t \*handler) const  
*Closes the packet capture handler and stops listening.*
- **Packet** **getPacketFromQueue** ()  
*Retrieves and removes a packet from the internal queue.*
- int **getNumberOfReceivedPackets** () const  
*Gets the number of packets currently in the queue.*

### 4.16.1 Opis szczegółowy

Class for capturing network packets.

This class provides functionality for capturing packets from network interfaces using the libpcap library. It maintains a queue of captured packets and handles the packet capture lifecycle.

### 4.16.2 Dokumentacja funkcji składowych

#### 4.16.2.1 closeAndStopListening()

```
void PacketSniffer::closeAndStopListening (
    pcap_t * handler) const
```

Closes the packet capture handler and stops listening.

##### Parametry

<i>handler</i>	<a href="#">Packet</a> capture handler to close.
----------------	--

#### 4.16.2.2 getNumberOfReceivedPackets()

```
int PacketSniffer::getNumberOfReceivedPackets () const [nodiscard]
```

Gets the number of packets currently in the queue.

##### Zwraca

int Number of captured packets waiting in the queue.

#### 4.16.2.3 getPacketFromQueue()

```
Packet PacketSniffer::getPacketFromQueue () [nodiscard]
```

Retrieves and removes a packet from the internal queue.

Zwraca

**Packet** The oldest packet in the queue.

#### 4.16.2.4 listenForPacket()

```
bool PacketSniffer::listenForPacket (
    pcap_t * snifferHandler,
    const std::string & interfaceName) [nodiscard]
```

Listens for a single packet on the specified interface.

This method captures one packet and adds it to the internal queue.

Parametry

<i>snifferHandler</i>	Active packet capture handler.
<i>interfaceName</i>	Name of the network interface.

Zwraca

**bool** True if a packet was successfully captured, false otherwise.

#### 4.16.2.5 openSnifferHandler()

```
pcap_t * PacketSniffer::openSnifferHandler (
    const std::string & interfaceName) [nodiscard]
```

Opens a packet capture handler for the specified network interface.

Parametry

<i>interfaceName</i>	Name of the network interface to capture packets from.
----------------------	--

Zwraca

**pcap\_t\*** Pointer to the packet capture handler.

Dokumentacja dla tej klasy została wygenerowana z plików:

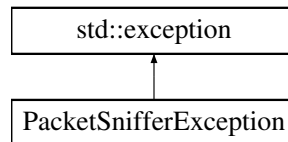

- src/packetsniffer/PacketSniffer.h
- src/packetsniffer/PacketSniffer.cpp

## 4.17 Dokumentacja klasy PacketSnifferException

Exception class for packet sniffer-related errors.

```
#include <PacketSnifferException.h>
```

Diagram dziedziczenia dla PacketSnifferException

### Metody publiczne

- [PacketSnifferException](#) (std::string msg)  
*Constructs a [PacketSnifferException](#) with a descriptive message.*
- const char \* [what](#) () const noexcept override  
*Returns the explanatory error message.*

### 4.17.1 Opis szczegółowy

Exception class for packet sniffer-related errors.

This exception is thrown when errors occur during packet capture operations.

### 4.17.2 Dokumentacja konstruktora i destruktor

#### 4.17.2.1 PacketSnifferException()

```
PacketSnifferException::PacketSnifferException (
    std::string msg) [inline], [explicit]
```

Constructs a [PacketSnifferException](#) with a descriptive message.

Parametry

<i>msg</i>	Error message describing the exception.
------------	---

### 4.17.3 Dokumentacja funkcji składowych

#### 4.17.3.1 what()

```
const char * PacketSnifferException::what () const [inline], [nodiscard], [override], [noexcept]
```

Returns the explanatory error message.

Zwraca

const char\* Pointer to the error message string.

Dokumentacja dla tej klasy została wygenerowana z pliku:

- src/exceptions/PacketSnifferException.h

## 4.18 Dokumentacja struktury StreamData

Structure containing data received from a virtual machine console stream.

```
#include <StreamData.h>
```

### Atrybuty publiczne

- char **buffer** [255]  
*Buffer containing data read from the stream.*
- bool **isStreamBroken**  
*Flag indicating whether the stream connection is broken.*

### 4.18.1 Opis szczegółowy

Structure containing data received from a virtual machine console stream.

This structure holds data read from a VM console stream along with the stream status.

Dokumentacja dla tej struktury została wygenerowana z pliku:

- src/models/StreamData.h

## 4.19 Dokumentacja klasy StringUtils

Utility class for string manipulation operations.

```
#include <StringUtils.h>
```

### Statyczne metody publiczne

- static void [copyStringToCharArray](#) (const std::string &src, char \*charArray, int length)  
*Copies a std::string to a character array with specified length.*

### 4.19.1 Opis szczegółowy

Utility class for string manipulation operations.

This class provides static helper methods for converting and copying strings.

### 4.19.2 Dokumentacja funkcji składowych

#### 4.19.2.1 copyStringToCharArray()

```
void StringUtils::copyStringToCharArray (  
    const std::string & src,  
    char * charArray,  
    int length) [static]
```

Copies a std::string to a character array with specified length.

This method safely copies a string to a fixed-size character array, ensuring null-termination and preventing buffer overflow.

**Parametry**

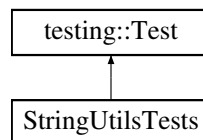

<i>src</i>	Source string to copy.
<i>charArray</i>	Destination character array.
<i>length</i>	Maximum length of the destination array including null terminator.

Dokumentacja dla tej klasy została wygenerowana z plików:

- src/Utils/StringUtils.h
- src/Utils/StringUtils.cpp

## 4.20 Dokumentacja klasy StringUtilsTests

Diagram dziedziczenia dla StringUtilsTests

Dokumentacja dla tej klasy została wygenerowana z pliku:

- tests/Utils/StringUtilsTests.cpp

## 4.21 Dokumentacja klasy TestingUtils

### Statyczne metody publiczne

- static void **expectThrowWithMessage** (const std::function< void()> &func, const std::string &expectedMessage)

Dokumentacja dla tej klasy została wygenerowana z plików:

- tests/TestingUtils.h
- tests/TestingUtils.cpp

## 4.22 Dokumentacja struktury Version

Structure representing a semantic version number.

```
#include <Version.h>
```

### Atrybuty publiczne

- unsigned int **major**  
*Major version number.*
- unsigned int **minor**  
*Minor version number.*
- unsigned int **patch**  
*Patch version number.*

#### 4.22.1 Opis szczegółowy

Structure representing a semantic version number.

This structure follows the semantic versioning convention (MAJOR.MINOR.PATCH).

Dokumentacja dla tej struktury została wygenerowana z pliku:

- src/models/Version.h

## 4.23 Dokumentacja klasy VersionUtils

Utility class for version number operations.

```
#include <VersionUtils.h>
```

### Statyczne metody publiczne

- static [Version](#) [getVersion](#) (unsigned long version)  
*Converts a packed version number to a [Version](#) structure.*

#### 4.23.1 Opis szczegółowy

Utility class for version number operations.

This class provides static helper methods for parsing and converting version numbers.

#### 4.23.2 Dokumentacja funkcji składowych

##### 4.23.2.1 getVersion()

```
Version VersionUtils::getVersion (  
    unsigned long version) [static]
```

Converts a packed version number to a [Version](#) structure.

This method decodes a libvirt-style packed version number (unsigned long) into separate major, minor, and patch components.

### Parametry

<code>version</code>	Packed version number (e.g., from libvirt API).
----------------------	---

### Zwraca

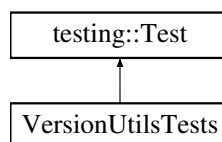

[Version](#) Structure containing major, minor, and patch version numbers.

Dokumentacja dla tej klasy została wygenerowana z plików:

- `src/utls/VersionUtils.h`
- `src/utls/VersionUtils.cpp`

## 4.24 Dokumentacja klasy VersionUtilsTests

Diagram dziedziczenia dla VersionUtilsTests

Dokumentacja dla tej klasy została wygenerowana z pliku:

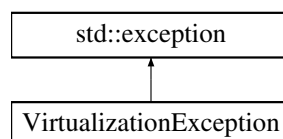

- `tests/utls/VersionUtilsTests.cpp`

## 4.25 Dokumentacja klasy VirtualizationException

Exception class for virtualization-related errors.

```
#include <VirtualizationException.h>
```

Diagram dziedziczenia dla VirtualizationException

### Metody publiczne

- [VirtualizationException](#) (std::string msg)  
*Constructs a [VirtualizationException](#) with a descriptive message.*
- `const char * what ()` const noexcept override  
*Returns the explanatory error message.*

### 4.25.1 Opis szczegółowy

Exception class for virtualization-related errors.

This exception is thrown when errors occur during virtualization operations

### 4.25.2 Dokumentacja konstruktora i destruktora

#### 4.25.2.1 `VirtualizationException()`

```
VirtualizationException::VirtualizationException (  
    std::string msg) [inline], [explicit]
```

Constructs a [VirtualizationException](#) with a descriptive message.

Parametry

<i>msg</i>	Error message describing the exception.
------------	---

### 4.25.3 Dokumentacja funkcji składowych

#### 4.25.3.1 `what()`

```
const char * VirtualizationException::what () const [inline], [nodiscard], [override], [noexcept]
```

Returns the explanatory error message.

Zwraca

`const char*` Pointer to the error message string.

Dokumentacja dla tej klasy została wygenerowana z pliku:

- `src/exceptions/VirtualizationException.h`

## 4.26 Dokumentacja klasy `VirtualizationFacade`

Facade class providing a unified interface for virtualization operations.

```
#include <VirtualizationFacade.h>
```

## Metody publiczne

- **VirtualizationFacade** (*ILibvirtWrapper* \*libvirt)  
*Constructs a [VirtualizationFacade](#) with a specific libvirt wrapper.*
- **VirtualizationFacade** ()  
*Constructs a [VirtualizationFacade](#) with default libvirt wrapper.*
- void **initializeConnection** (const char \*customConnectionUrl) const  
*Initializes the connection to the hypervisor.*
- void **getConnectionInfo** (*ConnectionInfo* \*infoPtr) const  
*Retrieves detailed information about the hypervisor connection.*
- void **createVirtualMachine** (const std::string &virtualMachineXml) const  
*Creates a new virtual machine from XML definition.*
- void **getInfoAboutVirtualMachine** (*VirtualMachineInfo* \*virtualMachineInfo, const std::string &name) const  
*Retrieves information about a specific virtual machine.*
- void **getListOfVirtualMachinesWithInfo** (*VirtualMachineInfo* \*\*arrayOfVirtualMachines, int \*numberOfVirtualMachines) const  
*Retrieves a list of all virtual machines with their information.*
- void **isConnectionAlive** (bool \*isAlive) const  
*Checks if the hypervisor connection is alive.*
- *virStreamPtr* **openVirtualMachineConsole** (const std::string &vmUuid) const  
*Opens a console stream to a virtual machine.*
- void **receiveDataFromConsole** (*virStreamPtr* stream, *StreamData* \*streamData) const  
*Receives data from a virtual machine console.*
- void **sendDataToConsole** (*virStreamPtr* stream, const std::string &data) const  
*Sends data to a virtual machine console.*
- void **closeStream** (*virStreamPtr* stream) const  
*Closes a console stream.*
- *virNetworkPtr* **createVirtualNetworkFromXml** (const std::string &networkDefinition) const  
*Creates a virtual network from XML definition.*
- void **attachDeviceToVm** (const std::string &uuid, const std::string &deviceDefinition) const  
*Attaches a device to a virtual machine.*
- void **detachDeviceFromVm** (const std::string &uuid, const std::string &deviceDefinition) const  
*Detaches a device from a virtual machine.*
- void **updateVmDevice** (const std::string &uuid, const std::string &deviceDefinition) const  
*Updates a device configuration in a virtual machine.*
- void **destroyNetwork** (const std::string &name) const  
*Destroys (stops and removes) a virtual network.*
- std::string **getNetworkDefinition** (const std::string &name) const  
*Retrieves the XML definition of a virtual network.*

### 4.26.1 Opis szczegółowy

Facade class providing a unified interface for virtualization operations.

This class serves as a high-level interface that coordinates multiple manager classes to provide comprehensive virtualization functionality including connection management, virtual machine operations, console access, and network management.

## 4.26.2 Dokumentacja konstruktora i destruktora

### 4.26.2.1 `VirtualizationFacade()`

```
VirtualizationFacade::VirtualizationFacade (  
    ILibvirtWrapper * libvirt) [explicit]
```

Constructs a `VirtualizationFacade` with a specific libvirt wrapper.

## Parametry

<i>libvirt</i>	Pointer to an <a href="#">ILibvirtWrapper</a> implementation.
----------------	---

## 4.26.3 Dokumentacja funkcji składowych

### 4.26.3.1 attachDeviceToVm()

```
void VirtualizationFacade::attachDeviceToVm (
    const std::string & uuid,
    const std::string & deviceDefinition) const
```

Attaches a device to a virtual machine.

## Parametry

<i>uuid</i>	UUID of the virtual machine.
<i>deviceDefinition</i>	XML string defining the device to attach.

### 4.26.3.2 closeStream()

```
void VirtualizationFacade::closeStream (
    virStreamPtr stream) const
```

Closes a console stream.

## Parametry

<i>stream</i>	Console stream to close.
---------------	--------------------------

### 4.26.3.3 createVirtualMachine()

```
void VirtualizationFacade::createVirtualMachine (
    const std::string & virtualMachineXml) const
```

Creates a new virtual machine from XML definition.

## Parametry

<i>virtualMachineXml</i>	XML string defining the virtual machine configuration.
--------------------------	--

### 4.26.3.4 createVirtualNetworkFromXml()

```
virNetworkPtr VirtualizationFacade::createVirtualNetworkFromXml (
    const std::string & networkDefinition) const [nodiscard]
```

Creates a virtual network from XML definition.

## Parametry

<i>networkDefinition</i>	XML string defining the network configuration.
--------------------------	--

## Zwraca

`virNetworkPtr` Pointer to the created network.

**4.26.3.5 `destroyNetwork()`**

```
void VirtualizationFacade::destroyNetwork (
    const std::string & name) const
```

Destroys (stops and removes) a virtual network.

## Parametry

<i>name</i>	Name of the network to destroy.
-------------	---------------------------------

**4.26.3.6 `detachDeviceFromVm()`**

```
void VirtualizationFacade::detachDeviceFromVm (
    const std::string & uuid,
    const std::string & deviceDefinition) const
```

Detaches a device from a virtual machine.

## Parametry

<i>uuid</i>	UUID of the virtual machine.
<i>deviceDefinition</i>	XML string defining the device to detach.

**4.26.3.7 `getConnectionInfo()`**

```
void VirtualizationFacade::getConnectionInfo (
    ConnectionInfo * infoPtr) const
```

Retrieves detailed information about the hypervisor connection.

## Parametry

<i>infoPtr</i>	Pointer to <a href="#">ConnectionInfo</a> structure to be filled with connection data.
----------------	--

**4.26.3.8 `getInfoAboutVirtualMachine()`**

```
void VirtualizationFacade::getInfoAboutVirtualMachine (
    VirtualMachineInfo * virtualMachineInfo,
    const std::string & name) const
```

Retrieves information about a specific virtual machine.

## Parametry

<i>virtualMachineInfo</i>	Pointer to <a href="#">VirtualMachineInfo</a> structure to be filled.
<i>name</i>	Name of the virtual machine.

**4.26.3.9 getListOfVirtualMachinesWithInfo()**

```
void VirtualizationFacade::getListOfVirtualMachinesWithInfo (
    VirtualMachineInfo ** arrayOfVirtualMachines,
    int * numberOfVirtualMachines) const
```

Retrieves a list of all virtual machines with their information.

## Parametry

<i>arrayOfVirtualMachines</i>	Pointer to array that will be allocated and filled with VM info.
<i>numberOfVirtualMachines</i>	Pointer to integer that will store the count of VMs.

**4.26.3.10 getNetworkDefinition()**

```
std::string VirtualizationFacade::getNetworkDefinition (
    const std::string & name) const [nodiscard]
```

Retrieves the XML definition of a virtual network.

## Parametry

<i>name</i>	Name of the network.
-------------	----------------------

## Zwraca

std::string XML definition of the network.

**4.26.3.11 initializeConnection()**

```
void VirtualizationFacade::initializeConnection (
    const char * customConnectionUrl) const
```

Initializes the connection to the hypervisor.

## Parametry

<i>customConnectionUrl</i>	Optional custom connection URL. If nullptr, default connection is used.
----------------------------	---

**4.26.3.12 isConnectionAlive()**

```
void VirtualizationFacade::isConnectionAlive (
    bool * isAlive) const
```

Checks if the hypervisor connection is alive.

## Parametry

<i>isAlive</i>	Pointer to boolean that will store the connection status.
----------------	---

**4.26.3.13 openVirtualMachineConsole()**

```
virStreamPtr VirtualizationFacade::openVirtualMachineConsole (
    const std::string & vmUuid) const [nodiscard]
```

Opens a console stream to a virtual machine.

## Parametry

<i>vmUuid</i>	UUID of the virtual machine to connect to.
---------------	--

## Zwraca

virStreamPtr Pointer to the opened console stream.

**4.26.3.14 receiveDataFromConsole()**

```
void VirtualizationFacade::receiveDataFromConsole (
    virStreamPtr stream,
    StreamData * streamData) const
```

Receives data from a virtual machine console.

## Parametry

<i>stream</i>	Active console stream to read from.
<i>streamData</i>	Pointer to <a href="#">StreamData</a> structure to be filled with received data.

**4.26.3.15 sendDataToConsole()**

```
void VirtualizationFacade::sendDataToConsole (
    virStreamPtr stream,
    const std::string & data) const
```

Sends data to a virtual machine console.

## Parametry

<i>stream</i>	Active console stream to write to.
<i>data</i>	Data string to send to the console.

**4.26.3.16 updateVmDevice()**

```
void VirtualizationFacade::updateVmDevice (
    const std::string & uuid,
    const std::string & deviceDefinition) const
```

Updates a device configuration in a virtual machine.

## Parametry

<i>uuid</i>	UUID of the virtual machine.
<i>deviceDefinition</i>	XML string defining the new device configuration.

Dokumentacja dla tej klasy została wygenerowana z plików:

- src/virt/VirtualizationFacade.h
- src/virt/VirtualizationFacade.cpp

## 4.27 Dokumentacja klasy VirtualMachineConsoleManager

Manages virtual machine console connections.

```
#include <VirtualMachineConsoleManager.h>
```

Diagram dziedziczenia dla VirtualMachineConsoleManager

### Metody publiczne

- virStreamPtr [openVirtualMachineConsole](#) (const std::string &vmUuid) const

**4.27.1 Opis szczegółowy**

Manages virtual machine console connections.

This class provides functionality for opening and managing console streams to virtual machines, allowing for interactive terminal access.

**4.27.2 Dokumentacja funkcji składowych****4.27.2.1 BaseManagerWithConnection()**

```
BaseManagerWithConnection::BaseManagerWithConnection (
    ILibvirtWrapper * libvirt) [inline], [explicit]
```

Constructs a [BaseManagerWithConnection](#) with a specific libvirt wrapper.

**Parametry**

<i>libvirt</i>	Pointer to an <a href="#">ILibvirtWrapper</a> implementation.
----------------	---

**4.27.2.2 closeStream()**

```
void VirtualMachineConsoleManager::closeStream (
    virStreamPtr stream) const
```

Closes a console stream and releases resources.

**Parametry**

<i>stream</i>	Console stream to close.
---------------	--------------------------

**4.27.2.3 getDataFromStream()**

```
void VirtualMachineConsoleManager::getDataFromStream (
    virStreamPtr stream,
    StreamData * streamData) const
```

Receives data from a virtual machine console stream.

## Parametry

<i>stream</i>	Active console stream to read from.
<i>streamData</i>	Pointer to <a href="#">StreamData</a> structure to be filled with received data.

**4.27.2.4 openVirtualMachineConsole()**

```
virStreamPtr VirtualMachineConsoleManager::openVirtualMachineConsole (
    const std::string & vmUuid) const
```

Opens a console stream to a virtual machine.

## Parametry

<i>vmUuid</i>	UUID of the virtual machine to connect to.
---------------	--

## Zwraca

virStreamPtr Pointer to the opened console stream.

**4.27.2.5 sendDataToStream()**

```
void VirtualMachineConsoleManager::sendDataToStream (
    virStreamPtr stream,
    const char * data,
    int dataSize) const
```

Sends data to a virtual machine console stream.

## Parametry

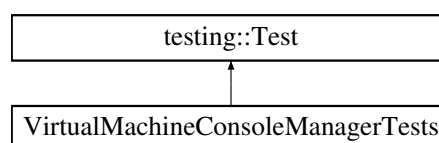

<i>stream</i>	Active console stream to write to.
<i>data</i>	Data to send to the console.
<i>dataSize</i>	Size of data in bytes.

### 4.30.1 Opis szczegółowy

Manages virtual machines.

This class handles the connection to the libvirt backend and operations related to virtual machines such as creation and retrieving information.

### 4.30.2 Dokumentacja funkcji składowych

#### 4.30.2.1 [attachDeviceToVirtualMachine](#)()

```
void VirtualMachineManager::attachDeviceToVirtualMachine (
    const std::string & uuid,
    const std::string & deviceDefinition) const
```

Attaches a device to a virtual machine.

## Parametry

<i>uuid</i>	UUID of the virtual machine.
<i>deviceDefinition</i>	XML string defining the device to attach.

**4.30.2.2 BaseManagerWithConnection()**

```
BaseManagerWithConnection::BaseManagerWithConnection (
    ILibvirtWrapper * libvirt) [inline], [explicit]
```

Constructs a [BaseManagerWithConnection](#) with a specific libvirt wrapper.

## Parametry

<i>libvirt</i>	Pointer to an <a href="#">ILibvirtWrapper</a> implementation.
----------------	---

**4.30.2.3 createVirtualMachine()**

```
void VirtualMachineManager::createVirtualMachine (
    const std::string & virtualMachineXml) const
```

Creates a virtual machine based on an XML configuration.

## Parametry

<i>virtualMachineXml</i>	XML string describing the virtual machine configuration.
--------------------------	--

**4.30.2.4 detachDeviceFromVirtualMachine()**

```
void VirtualMachineManager::detachDeviceFromVirtualMachine (
    const std::string & uuid,
    const std::string & deviceDefinition) const
```

Detaches a device from a virtual machine.

## Parametry

<i>uuid</i>	UUID of the virtual machine.
<i>deviceDefinition</i>	XML string defining the device to detach.

**4.30.2.5 getInfoAboutVirtualMachine()**

```
VirtualMachineInfo VirtualMachineManager::getInfoAboutVirtualMachine (
    const std::string & name) [virtual]
```

Retrieves information about a virtual machine identified by its name.

## Parametry

<i>name</i>	Name string of the virtual machine.
-------------	-------------------------------------

## Zwraca

[VirtualMachineInfo](#) Information about the virtual machine.

4.30.2.6 `getListOfVirtualMachinesWithInfo()`

```
std::vector< VirtualMachineInfo > VirtualMachineManager::getListOfVirtualMachinesWithInfo ()
```

Retrieves a list of all virtual machines with their information.

## Zwraca

`std::vector<VirtualMachineInfo>` Vector containing information about all VMs.

4.30.2.7 `updateVmDevice()`

```
void VirtualMachineManager::updateVmDevice (
    const std::string & uuid,
    const std::string & deviceDefinition) const
```

Updates a device configuration in a virtual machine.

## Parametry

<i>uuid</i>	UUID of the virtual machine.
<i>deviceDefinition</i>	XML string defining the new device configuration.

### 4.33.1 Opis szczegółowy

Manages virtual networks.

This class provides functionality for creating, destroying, and managing virtual networks using libvirt.

### 4.33.2 Dokumentacja funkcji składowych

#### 4.33.2.1 BaseManagerWithConnection()

```
BaseManagerWithConnection::BaseManagerWithConnection (
    ILibvirtWrapper * libvirt) [inline], [explicit]
```

Constructs a [BaseManagerWithConnection](#) with a specific libvirt wrapper.

Parametry

<i>libvirt</i>	Pointer to an <a href="#">ILibvirtWrapper</a> implementation.
----------------	---

#### 4.33.2.2 createNetworkFromXml()

```
virNetworkPtr VirtualNetworkManager::createNetworkFromXml (
    const std::string & networkDefinition) const
```

Creates a virtual network from an XML definition.

**Parametry**

<i>networkDefinition</i>	XML string defining the network configuration.
--------------------------	--

**Zwraca**

virNetworkPtr Pointer to the created network.

**4.33.2.3 destroyNetwork()**

```
void VirtualNetworkManager::destroyNetwork (  
    const std::string & name) const
```

Destroys (stops and removes) a virtual network.

**Parametry**

<i>name</i>	Name of the network to destroy.
-------------	---------------------------------

**4.33.2.4 getNetworkXmlDefinition()**

```
std::string VirtualNetworkManager::getNetworkXmlDefinition (  
    const std::string & name) const [nodiscard]
```

Retrieves the XML definition of a virtual network.

**Parametry**

<i>name</i>	Name of the network.
-------------	----------------------

**Zwraca**

std::string XML definition of the network.
